Apply all list method in tuple in python

1. List methods vs Tuple methods

List Method	Tuple Alternative
append()	Not supported
extend()	Not supported
insert()	Not supported
remove()	Not supported
pop()	Not supported
clear()	Not supported
sort()	Not supported
reverse()	Not supported
index()	index()
count()	count()
copy()	Not supported

2. All Tuple Methods

Python has only 2 built-in tuple methods.

1. count()

Counts how many times an element appears.

//

```
t = (10, 20, 10, 30, 10)

print(t.count(10))
```

//

2. index()

Returns the index position of an element.

```
t = (10, 20, 30, 40)

print(t.index(30))
```

//

3. Built-in functions that work with tuples

```
t = (10, 20, 30, 40, 50)
```

```
print(len(t))      # Length
print(max(t))      # Maximum value
print(min(t))      # Minimum value
print(sum(t))      # Sum
print(sorted(t))   # Sorting
print(tuple(t))    # Convert into tuple
print(any(t))      # Any element is true
print(all(t))      # All elements are true
```

//

4. How to apply list methods to a tuple?

If you want to use list methods on a tuple, first convert it into a list.

```
t = (10, 20, 30, 40)

l = list(t)

l.append(50)
l.insert(1, 15)
l.remove(30)
l.pop()

print(l)
```

//
